BCD (digital display)

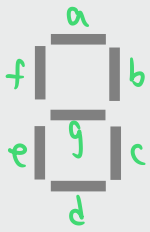
Following the example covered in class, get the simplified of a

⇒ A clock face with all lights turned off

A digital clock face is a grid of lights:

⇒ A clock face representing the number 7 with 3 lights turned on

So we can assign a variable to each light to control which turns on to represent any number 0-9



I_3	I_2	I_1	I_0	Decimal number that we want to represent	a	b	c	d	e	f	g
0	0	0	0	0	1	1	1	1	1	1	0
0	0	0	1	1	0	1	1	0	0	0	0
0	0	1	0	2	1	1	0	1	1	0	1

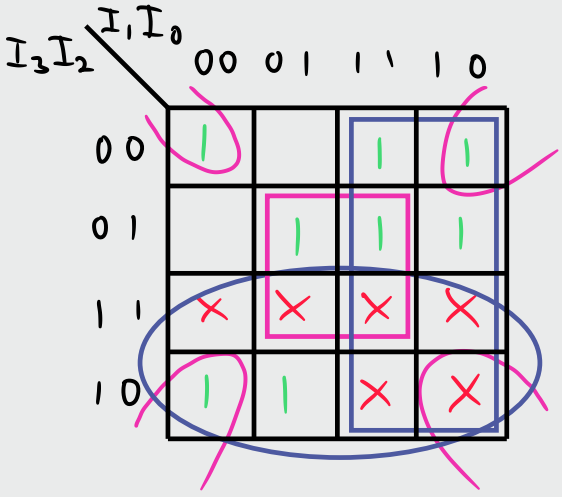
1	1	1	1	X	X	X	X	X	X	X	X

Don't Cares

we don't use these

Since we want the boolean expression that outputs a, we select select the entire column of a and feed it to a k-map

To represent the number 0, we want to turn on all lights except for light g



$$I_2'I_0' + I_2I_0 + I_3 + I_1$$

↳ Simplified expression of a
